HEMP UNIVERSE is a corporate trust designed to exploit INDUSTRIAL HEMP and to help industrialize ALL of the African continent, one nation at a time. Tanzania is the initial target market because of its geographical location, abundant labor resources and the national fiscal discipline that has been consistently maintained over many years. Although the platform is being initiated in TANZANIA, it is meant to benefit every nation on the African continent in many ways.

HEMP UNIVERSE will create a model of the various capabilities of the INDUSTRIAL HEMP platform that fosters industrial development in phases. The organization will also provide consulting and planning services to bring parallel businesses and nations into the INDUSTRIAL HEMP business. The architecture allows government organizations to oversee Public/Private entities so that the constituents of any nation are able to benefit using the many aspects of INDUSTRIAL HEMP production. The benefits include investment opportunities, entrepreneurial possibilities, carbon offsets, employment and vendor arrangements. Any and all aspects of this business model can be embraced by an enterprise. The government's primary role is to monitor, balance and manage the access to each business aspect so that no part of the opportunity is monopolized by any one individual or organization. The greatest success of this strategy lies in its ability to involve and empower every segment of the willing public and to raise the financial viability of the economy.

The products that are possible as a result of using this plant are almost endless. INDUSTRIAL HEMP can be used to replace many of the existing inferior and toxic products currently in the marketplace and to innovate consumer products by providing new uses and technologies that have not previously been possible. Historically there are several examples that can be identified and science has recently discovered several additional uses. [Please refer to [HEMP USES](https://hempfoundation.net/the-usages-of-every-part-of-hemp-plant/?unapproved=3458&moderation-hash=4a97e2cbbae1989f03e4f178de1d5542#comment-3458) - <https://hempfoundation.net/the-usages-of-every-part-of-hemp-plant/?unapproved=3458&moderation-hash=4a97e2cbbae1989f03e4f178de1d5542#comment-3458> ]

In this arrangement there can be a provision for **contract growers** on large dedicated parcels involved in this enterprise and also **smaller plot contributors** who sell HEMP by the kilogram to area processing plants.

As an industry in development, there must be allocated **Real Estate** for **processing plants**. **Colleges and universities** will not only include HEMP science as part of their curriculum, but shall also develop **research labs** to target uses and develop processes. Any available **bustani, garden, farm or shamba** will be eligible to contribute to production. The **machinery manufacturers** will design tools locally that will separate, cut and refine the components and prepare them for use in the finish products.

A large **transportation** concern will be created to deliver raw HEMP, while others will deliver refined products and still another segment will distribute finished products. Another segment of the industry will receive the **refined products to make food, medicine, tinctures, building products, cooking oil, milk, ink, paint, batteries, electronics, textiles and clothing**. Some business and individuals may choose to take part in several aspects of this industry. It will be possible to be a grower and an entrepreneur...AND, a **retailer** of some finished product. There can be single entity companies as well as public companies in this business. The public side will be run as corporations with public shareholders to increase the possible streams of income available to citizens. However, every single entity or individual should be limited to no more than **ten (10) per cent ownership** of shares in any processing facility.

It is recommended that each entity be separate and distinct from all others and have a focused segment of the industry to specialize in. All residents and nationals should be encouraged to participate in stock ownership. Multiple entity investment may be possible as long as the **ten (10)** per cent limit is always observed regardless of legal standing or status.

The **government should control twenty (20) per cent** of every public entity in the processing system to maintain **authority** and **administer taxes**. As a result the government shall be responsible for **maintaining each facility, accounting and plant management**. These functions shall be expense items that are deducted before profit and taxes are determined.

In this description there are thirty-two (32) distinct functions mentioned. Most of these functions offer multiple opportunities for many individuals and organizations as entrepreneurs, investors and employees. Teachers and trainers are also a viable part of this endeavor as the thirty-third (33rd) aspect of this enterprise that is responsible for providing the initial direction and orientation for each functional discipline.

As an added bonus to the many provisions of INDUSTRIAL HEMP cultivation, it is possible to lease INDUSTRIAL HEMP pasture for carbon credit during the cultivation cycle. This requires a constant quantifiable average amount of INDUSTRIAL HEMP growing at all times. This revenue requires no additional effort. The only requirement is to actively manage the availability of a constant minimum growing at all times. This quantity need not be in the same physical location.

There is so much provision and so many possibilities available for the INDUSTRIAL HEMP industry that it very difficult to imagine the limits of this plant. As a result the revenue from these businesses is only limited by the acreage committed to the businesses.
